

1 minute read on Web scraping

Web scraping is a term used to describe the use of a program or algorithm to extract and process large amounts of data from the web.

Whether you are a data scientist, engineer, or anybody who analyzes large amounts of datasets, the ability to scrape data from the web is a useful skill to have.

Let's say you find data from the web, and there is no direct way to download it, web scraping using Python is a skill you can use to extract the data into a useful form that can be imported.

Let's code a web scrapper in Rocky Sir's Training batch!!
